Claims 1-9 are objected to because of the following informalities: In claim 1, line 3, - - first - - should precede "semiconductor region" in view of the recitation "first semiconductor region" in lines 6 and 7. Appropriate correction is required.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Keys et al 2004/0235280.

It is noted that in the instant claims "dopant" is used to encompass non-conductive impurities. Also, "dopant atoms" and "dopant ions" are used interchangeably where in ion implantation processes it is ions that are implanted. The following rejection is predicated on these uses.

Keys et al discloses formation of a p-type or n-type transistor [0035, figures 5A and 5B and accompanying description] including implanting Si or Ge ions to amorphize a portion of an n-doped substrate region [0024], implanting F temporary ions [0025-0026], annealing at 400-800°C for 5-120 seconds [0028] then implanting boron ions [0027]. See figure 3. The recited annealing temperature range overlaps the disclosed range.
